

Trial Intelligence Report

NCT ID	NCT00035906	Status	COMPLETED
Phase	PHASE2	Sponsor	Allergan
Enrollment	315	Start Date	2001-10

Trial Title

Research Study in Patients With Persistent Macular Edema

Executive Summary

This Phase 2 clinical trial evaluates the safety and efficacy of a novel treatment for patients with persistent macular edema (ME) associated with diabetic retinopathy, uveitis, retinal vein occlusion, or Irvine-Gass syndrome. The trial enrolled patients who have experienced persistent ME, despite previous laser treatment or medical management by a physician, with a minimum duration of 90 days. The study aimed to assess the safety and efficacy of the investigational treatment in reducing macular edema, improving visual acuity, and enhancing quality of life in patients with persistent ME. A total of [number] patients were included in the trial, and [number] patients were randomized to receive the investigational treatment versus a placebo. The primary endpoints of the trial were the change in central macular thickness (CMT) and visual acuity at [number] weeks post-treatment. The trial was completed, and the results will provide valuable insights into the safety and efficacy of the investigational treatment in patients with persistent ME.

Eligibility Criteria

Inclusion: Persistent macular edema associated with diabetic retinopathy, uveitis, retinal vein occlusion, or Irvine-Gass syndrome, persisting at least 90 days after laser treatment or medical management by a physician. Exclusion: Females who are pregnant or lactating, and females of childbearing potential not using adequate birth control for the duration of the study. Any intraocular procedures or laser treatment less than 90 days before enrollment.
